

## Post Treatment Instructions

Insects have adapted very well to their environments. The insect eggs and pupa cases are well protected and have the ability to survive extremes such as heat, cold, drought, floods and pesticides. Pesticides do have a major impact on insects after they emerge out of the egg or pupa case.

Insects also spend as much as 80% of their life in their nesting or breeding areas that are usually located in walls or very secluded areas, which we simply cannot access. Because of this, you must allow two weeks for our material(s) to have an impact on the pest(s) we have treated.

Given the appropriate amount of time for insects to make contact with our material will bring about control. If a touch-up service is required, please be specific as to the area where the problem is occurring. Re-treatment (touch-up service) will be limited to only the areas where active infestation exists.

1. Do not use a damp cloth or sponge on the inside of cabinets for at least 30 days after treatment.
2. All counter tops should be washed with soapy water immediately after treatment to remove any light mist that may have occurred.
3. If we treated for fleas, vacuum 2 days after treatment to speed up the pupa case hatching process.

**Vacuum daily for 2 weeks thereafter.** This will help to continue the pupa hatching process. Also vacuum tile, linoleum or wood floors daily. Dispose of vacuum cleaner bags or empty canister outside of household after each vacuuming. **Do not have carpets steam cleaned until after total control has been achieved.**

**If possible, bathe pet with flea shampoo weekly during flea season (June thru November) and/or use a monthly flea treatment.**

If you have questions, please contact us at (949) 261-0700 – Pest Control Department.

Thank you,  
Newport Exterminating
